Amendments to the Claims

1. (original) A method for controlling exposure time in a digital image capture device comprising the steps of:

when a user-controlled exposure mode is selected and a start exposure signal is asserted, a) capturing a first image and assigning the first image to a running total image;

b) displaying the running total image;

c) capturing a next image;

d) adding the next image to the running total image;

e) displaying the running total image; and

f) repeating steps (c) to (e) until a terminate exposure signal is asserted.

2. (original) The method of claim 1 wherein the digital image capture device include an image sensor; wherein the step of capturing the first image includes the steps of

a\_1) exposing the image sensor to light;

a\_2) reading out an analog value from the image sensor; and

a\_3) converting the analog value to a corresponding digital value; and

wherein the step of capturing the next image includes the steps of

c\_1) exposing the image sensor to light;

c\_2) reading out an analog value from the image sensor; and

c\_3) converting the analog value to a corresponding digital value.

3. (original) The method of claim 1 wherein the digital image capture device includes a display; and wherein the step of displaying the running total image includes displaying the running total image on the display.

4. (original) The method of claim 1 further comprising the step of:

S/N. 10/035,785  
Norman C. Pyle  
Atty Dkt 10011327-1

transferring a final image to a storage media.

5. (currently amended) The method of claim 4 wherein the storage media is one of a removable storage media, volatile memory, and non-volatile memory.

6. (original) The method of claim 1 further comprising the step of:  
    wherein the asserted terminate exposure signal is a de-asserted start exposure signal; and  
    wherein the start exposure signal is asserted and de-asserted by employing a cable release.

7. (currently amended) The method of claim 1 wherein the step of asserting the start exposure signal includes the step of asserting the start exposure signal by ~~employ a~~ employing a remote control; and wherein the step of asserting the terminate exposure signal includes the step of asserting the terminate exposure signal by employing a remote control.

8. (original) The method of claim 7 wherein the remote control utilizes one of an infrared link, a radio frequency link, and an audio link.

9. (original) The method of claim 7 wherein the digital image capture device is a digital camera.

10. (original) A digital image capture device that has a user-controlled exposure mode comprising:  
    a) a display for displaying images; and  
    b) a user-controlled exposure mechanism coupled to the display for receiving a start exposure signal and a terminate exposure signal, responsive to the start exposure signal for beginning an exposure, for providing visual

Norman C. Pyle  
Atty Dkt 10011327-1

feedback during the exposure through the display, and responsive to a terminate exposure signal for terminating the exposure.

11. (original) The digital image capture device of claim 10 further comprising:  
an enable signal for enabling the user-controlled exposure mechanism  
and setting the digital camera into a user-controlled exposure mode.

12. (currently amended) The digital image capture device of ~~claim 10~~ claim 11  
further comprising:

a first button for use by a user to assert the start exposure signal and  
to assert the terminate exposure signal; and

a second button for use by a user to assert the enable signal.

13. (original) The digital image capture device of claim 12 further comprising a  
separate button for use by a user to assert the terminate exposure signal.

14. (original) The digital image capture device of claim 10 wherein the  
user-controlled exposure mechanism includes:

a visual feedback module for providing visual feedback during the  
exposure through the display.

15. (original) The digital image capture device of claim 10 wherein the digital  
image capture device is a digital camera.

16. (original) A digital image capture device that has a user-controlled  
exposure mode comprising:

a) means for displaying images; and

b) user-controlled exposure means coupled to the display for receiving  
a start exposure signal and a terminate exposure signal, responsive to the  
start exposure signal for beginning an exposure, for providing immediate

visual feedback during the exposure through the display, and responsive to a terminate exposure signal for terminating the exposure.

17. (original) The digital image capture device of claim 16 further comprising:  
an enable signal for enabling the user-controlled exposure mechanism  
and setting the digital camera into a user-controlled exposure mode.

18. (currently amended) The digital image capture device of claim 16 further comprising:

- c) first means for use by a user to assert a start exposure signal;
- d) second means for use by a user to assert a terminate exposure signal; and
- e) third means for use by a user to set the ~~digital camera~~ digital image capture device into the user-controlled exposure mode.

19. (currently amended) The ~~digital camera~~ digital image capture device of claim 18 wherein the first means and the second means are a single button.

20. (currently amended) The ~~digital camera~~ digital image capture device of claim 16 wherein the user-controlled exposure means includes:

- a visual feedback means for providing visual feedback during the exposure through the display.
